The 2023 New Zealand Election Study

Administered by mail (with online option). Sampling frame was the computerised New Zealand Electoral Roll.

Voting data has been validated by reference to the marked electoral rolls.

The basic weight, vwgt, adjusts for gender, age, Maori/non-Maori descent, education, Auckland/not Auckland, vote and nonvote. A gender, age, Maori/non-Maori descent weight is also available (bwgt).

The dataset contains an oversample of those of Māori descent, adjusted downward in the two weights. An additional weight, mwgt, adjusts the Maori subsample to its actual sample size and zeros out all other respondents.

902 participants participated in the 2020 NZES, forming a panel. Variable msample identifies the components.

The open-ended issue question salience is coded in two ways – one by text searching, 'issues text search' the other by LLM.

Occupations are coded for ISCO08. Various occupational code options are also included, both on a male head of household basis and on participant occupation with other member of the household's occupation used where participant reported no occupation.

Data for questions D2 and D3 are not available for release.
